

DATA VISUALIZATION & STORYTELLING

Retail Sales Performance | Internship Task 2

A visual business report exploring sales, profit, customer segments, and regional performance across 2024–2025.

Orders	Total Sales	Total Profit	Profit Margin
1,200	\$1,055,265	\$138,192	13.1%

Executive summary

The simulated dataset contains 1,200 orders and generated \$1,055,265 in sales and \$138,192 in profit, for an overall margin of 13.1%. Technology leads category sales, and West leads regional sales. The report moves from trends to category, customer, and product-level findings.

Data and scope

This synthetic practice dataset covers January 2024 through December 2025. It demonstrates analysis and storytelling techniques and does not represent actual company performance.

1. Sales over time

A line chart is suited to time series and reveals month-to-month movement. February 2024 is the strongest sales month in this dataset. Use monthly patterns to inform inventory, staffing, and campaign planning.

2. Category performance

A bar chart makes category comparison straightforward. Technology leads sales. Sales should be considered alongside profit and margin before making investment decisions.

3. Regional performance

West records the highest sales among the four regions. Compare regional profit as well; high revenue does not automatically mean high profitability.

4. Customer mix

Share of Sales by Customer Segment

Consumer contributes the largest sales share. A pie chart works here because there are only three segments and each is part of the whole.

5. Profit by sub-category

Paper is the weakest sub-category by profit, while Machines is the strongest. Investigate pricing, discounting, costs, and demand before corrective action.

Business recommendations

- Track profit margin alongside sales, especially in the leading category (Technology).
- Review Paper pricing, discounts, and costs before repricing or changing assortment.
- Study what drives the leading region and test transferable practices elsewhere.
- Use monthly patterns to align inventory and marketing with demand.
- Design dashboards around decision-making: KPIs first, then trends and breakdowns with clear titles and units.

Conclusion

A small set of carefully selected visuals can turn transactions into an actionable narrative: establish performance, identify its sources, examine profitability, and recommend focused follow-up. In a real business, validate results against source data and investigate drivers with stakeholders.
